

Alumni Legacy Poster Generator

Claude Code Master Prompt

Objective

Build a production-ready full-stack web app that generates premium alumni posters from an uploaded portrait. The system must dynamically discover each school's official colors, mascot, city skyline, landmarks, and branding. Never hardcode school-specific assets.

Tech Stack

Next.js 16, React, TypeScript, Tailwind CSS, shadcn/ui, Supabase, PostgreSQL, Edge Functions, Vercel. Modular AI provider abstraction.

Workflow

Upload portrait; remove background; collect city, state, school, graduation year; lookup verified school metadata; cache results; assemble prompt; generate artwork; overlay crisp typography and logos programmatically; export print-ready PNG/JPG/PDF.

Dynamic Data

Lookup official school colors, mascot, logo, building, motto, nickname, skyline and landmarks using Wikipedia API, OpenStreetMap/Nominatim, Wikimedia Commons and cached verified data. Never assume colors or use example schools.

Poster Styles

Sports, Varsity, Luxury, Vintage, Military Tribute, Hall of Fame, Movie Poster, Magazine Cover, Street Art.

AI Prompt Template

Create an ultra-premium championship style alumni poster using the supplied portrait without changing facial identity. Use the verified school colors, mascot, skyline, school architecture and graduation year. Apply cinematic lighting, paint splashes, smoke, layered textures, depth, dramatic shadows, premium apparel styling and print-quality detail. Do not generate random text. All typography will be added programmatically.

Free APIs

Wikipedia API; Wikimedia Commons API; OpenStreetMap Nominatim; Hugging Face Inference (FLUX.1 Schnell, BRIA RMBG); Pollinations.ai; Real-ESRGAN self-hosted; ColorThief; Tesseract.js; Supabase Free Tier.

Architecture

Separate factual metadata from AI creativity. Cache verified school records. Provide admin editing for metadata. Provider interface: generateImage(), removeBackground(), upscale(), generateMascot().
